Chapter NR 464

NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS FROM THE PULP AND PAPER INDUSTRY

NR 464.01 Applicability; purpose. (1) APPLICABILITY. (a) The provisions of this chapter apply to the owner or operator of processes that produce pulp, paper or paperboard; that are located at a plant site that is a major source as defined in s. NR 460.02 (24) and that use any of following processes and materials:
   1. Kraft, soda, sulfite or semi–chemical pulping processes using wood.
   2. Mechanical pulping processes using wood.
   3. Any process using secondary or non–wood fibers.
   (b) The affected source to which the existing source provisions of this chapter apply is as follows:
      1. For the processes specified in par. (a) 1., the affected source is the total of all HAP emission points in the pulping and bleaching systems.
      2. For the processes specified in par. (a) 2. or 3., the affected source is the total of all HAP emission points in the bleaching system.
      (c) The new source provisions of this chapter apply to the total of all HAP emission points at new or existing sources as follows:
         1. Each affected source defined in par. (b) 1. that commences construction or reconstruction after December 17, 1993.
         2. Each pulping system or bleaching system for the processes specified in par. (a) 1. that commences construction or reconstruction after December 17, 1993.
         3. Each additional pulping or bleaching line at the processes specified in par. (a) 1. that commences construction after December 17, 1993.
         4. Each affected source defined in par. (b) 2. that commences construction or reconstruction after March 8, 1996.
         5. Each additional bleaching line at the processes specified in par. (a) 2. or 3. that commences construction after March 8, 1996.
   (d) Each existing source shall achieve compliance no later than April 16, 2001, except as provided in par. (e) and subs. 1. and 2.:
      1. Each Kraft pulping system shall achieve compliance with the pulping system provisions of s. NR 464.03 for the equipment listed in s. NR 464.03 (1) (a) 2. to 5. as expeditiously as practicable, but in no event later than April 16, 2001, and the owners and operators shall establish dates, update dates and report the dates for the milestones specified in s. NR 464.11 (2).
      2. Each dissolving–grade bleaching system at either kraft or sulfite pulping mills shall achieve compliance with the bleach plant provisions of s. NR 464.05 as expeditiously as practicable, but in no event later than April 16, 2001, or shall comply with all of the following:
         1. The owner or operator of a bleaching system shall comply with the bleach plant provisions of s. NR 464.05 as expeditiously as practicable, but in no event later than April 15, 2004.
         2. The owner or operator of a bleaching system shall comply with the requirements specified in either of the following:
            a. Not increase the application rate of chloride or hypochlorite, in kg of bleaching agent per megagram of ODP, in the bleaching system above the average daily rates used over the 3 months prior June 15, 1998, until the requirements of subd. 1. are met, and record application rates as specified in s. NR 464.10 (3).
            b. Comply with enforceable effluent limitations guidelines for 2,3,7,8–tetrachlorodibenzo–p–dioxin and adsorbable organic halides at least as stringent as the baseline best available technology economically achievable levels set in 40 CFR 430.24(a) (1) as expeditiously as possible, but in no event later than April 16, 2001.
         3. Owners and operators shall establish dates, update dates and report the dates for the milestones specified in s. NR 464.11 (2).
   (f) Each new source, specified as the total of all HAP emission points for the sources specified in par. (c), shall achieve compliance upon startup or by June 15, 1998, whichever is later, as provided in s. NR 460.05 (2).
   (g) Each owner or operator of an affected source with affected process equipment shared by more than one type of pulping process shall comply with the applicable requirement in this chapter that achieves the maximum degree of reduction in HAP emissions.
   (h) Each owner or operator of an affected source specified in pars. (a) to (c) shall comply with the requirements of ch. NR 460, according to the applicability of ch. NR 460 to the sources, as indicated in Appendix S of ch. NR 460.
   (i) All references to 40 CFR part 63 and 40 CFR part 430 in this chapter mean those parts of the code of federal regulations as in effect on April 1, 2002, except that in the case of CFR provisions incorporated by reference in ch. NR 484, if a more recent date is specified in the applicable section of ch. NR 484, that date shall apply.
      Note: Compliance dates are federally enforceable under 40 CFR 63.440 prior to the effective date of this section.

(2) PURPOSE. This chapter is adopted under ss. 285.27 (2) and 285.65, Stats., to establish emission standards for hazardous air pollutants from the pulp and paper industry.

Note: This chapter is based on the federal regulations contained in 40 CFR part 63 subpart S, created April 15, 1998, as last revised on December 22, 2000.

History: CR 00–175; cr. Register March 2002 No. 555, eff. 4–1–02.

NR 464.02 Definitions. For terms not defined in this section, the definitions contained in chs. NR 400 and 460 apply to the terms used in this chapter, with definitions in ch. NR 460 taking priority over definitions in ch. NR 400. In addition, the definitions...
in this section apply to the terms used in this chapter. If this section defines a term which is also defined in ch. NR 400 or 460, the definition in this section applies in this chapter. In this chapter:

(1) “Acid condensate storage tank” means any storage tank containing cooking acid following the sulfur dioxide gas fortification process.

(2) “Black liquor” means spent cooking liquor that has been separated from the pulp produced by the Kraft and soda or semi-chemical pulping processes.

(3) “Bleaching” means brightening of pulp by the addition of oxidizing chemicals or reducing chemicals.

(4) “Bleaching line” means a group of bleaching stages arranged in series such that bleaching of the pulp progresses as the pulp moves from one stage to the next.

(5) “Bleaching stage” means all process equipment associated with a discrete step of chemical application and removal in the bleaching process including chemical and steam mixers, bleaching towers, washers, seal (filtrate) tanks, vacuum pumps, and any other equipment serving the same function as those previously listed.

(6) “Bleaching system” means all process equipment after high-density pulp storage prior to the first application of oxidizing chemicals or reducing chemicals following the pulping system, up to and including the final bleaching stage.

(7) “Boiler” means any enclosed combustion device that extracts useful energy in the form of steam. A boiler is not considered a thermal oxidizer.

(8) “Chip steamer” means a vessel used for the purpose of pre-heating or pretreating wood chips prior to the digester, using flash steam from the digester or live steam.

(9) “Closed-vent system” means a system that is not open to the atmosphere and is composed of piping, ductwork, connections and, if necessary, flow-inducing devices that transport gas or vapor from an emission point to a control device.

(10) “Combustion device” means an individual unit of equipment, including but not limited to, a thermal oxidizer, lime kiln, recovery furnace, process heater or boiler, used for the thermal oxidation of organic hazardous air pollutant vapors.

(11) “Day” means any 24 hour period corresponding to either midnight to midnight or to the actual 24 hour production day used by a specific facility.

(12) “Decker system” means all equipment used to thicken the pulp slurry or reduce its liquid content after the pulp washing system and prior to high-density pulp storage. The decker system includes decker vents, filtrate tanks, associated vacuum pumps, and any other equipment serving the same function as those previously listed.

(13) “Digester system” means each continuous digester or each batch digester used for the chemical treatment of wood or non-wood fibers. The digester system equipment includes associated flash tanks, blow tanks, chip steamers not using live steam, blow heat recovery accumulators, relief gas condensers, prehydrolysis units preceding the pulp washing system, and any other equipment serving the same function as those previously listed. The digester system includes any of the liquid streams or condensates associated with batch or continuous digester relief, blow or flash steam processes.

(14) “Emission point” means any part of a stationary source that emits hazardous air pollutants regulated under this chapter, including emissions from individual process vents, stacks, open pieces of process equipment, equipment leaks, wastewater and condensate collection and treatment system units, and those emissions that could reasonably be conveyed through a stack, chimney or duct where such emissions first reach the environment.

(15) “Evaporator system” means all equipment associated with increasing the solids content or concentrating spent cooking liquor from the pulp washing system including pre-evaporators, multi-effect evaporators, concentrators and vacuum systems, as well as associated condensers, hotwells and condensate streams, and any other equipment serving the same function as those previously listed.

(16) “Flow indicator” means any device that indicates gas or liquid flow in an enclosed system.

(17) “High volume, low concentration collection system” or “HVLC collection system” means the gas collection and transport system used to convey gases from the HVLC system to a control device.

(18) “High volume, low concentration system” or “HVLC system” means the collection of equipment including the pulp washing, knotter, screen, decker and oxygen delignification systems, weak liquor storage tanks and any other equipment serving the same function as those previously listed.

(19) “Knotter system” means equipment where knots, oversized material or pieces of uncooked wood are removed from the pulp slurry after the digester and prior to the pulp washing system. The knotter system equipment includes the knotter, knot drainer tanks, ancillary tanks and any other equipment serving the same function as those previously listed.

(20) “Kraft pulping” means a chemical pulping process that uses a mixture of sodium hydroxide and sodium sulfide as the cooking liquor.

(21) “Lime kiln” means an enclosed combustion device used to calcine lime mud, which consists primarily of calcium carbonate, into calcium oxide.

(22) “Low volume, high concentration collection system” or “LVHC collection system” means the gas collection and transport system used to convey gases from the LVHC system to a control device.

(23) “Low volume, high concentration system” or “LVHC system” means the collection of equipment including the digester, turbine recovery, evaporator, steam stripper systems and any other equipment serving the same function as those previously listed.

(24) “Mechanical pulping” means a pulping process that only uses mechanical and thermo-mechanical processes to reduce wood to a fibrous mass. The mechanical pulping processes include, but are not limited to, stone groundwood, pressurized groundwood, refiner mechanical, thermal refiner mechanical, thermo-mechanical and tandem thermo-mechanical.

(25) “Non-wood pulping” means the production of pulp from fiber sources other than trees. The non-wood fiber sources include, but are not limited to, bagasse, cereal straw, cotton, flax straw, hemp, jute, kenaf and leaf fibers.

(26) “Oven-dried pulp” or “ODP” means a pulp sample at zero percent moisture content by weight.

(a) Pulp samples for applicability or compliance determinations for both the pulping and bleaching systems shall be un-bleached pulp.

(b) For purposes of complying with mass emission limits in this chapter, megagram of ODP shall be measured to represent the amount of pulp entering and processed by the equipment system under the specified mass limit.

(c) For equipment that does not process pulp, megagram of ODP shall be measured to represent the amount of pulp that was processed to produce the gas and liquid streams.

(27) “Oxygen delignification system” means the equipment that uses oxygen to remove lignin from pulp after high-density stock storage and prior to the bleaching system. The oxygen delignification system equipment includes the blow tank, washers, filtrate tanks, any interstage pulp storage tanks and any other equipment serving the same function as those previously listed.
“Primary fuel” means the fuel that provides the principal heat input to the combustion device. To be considered primary, the fuel must be able to sustain operation of the combustion device without the addition of other fuels.

“Process wastewater treatment system” means a collection of equipment, a process or a specific technique that removes or destroys the HAPs in a process wastewater stream. Examples include, but are not limited to, a steam stripping unit, wastewater thermal oxidizers or biological treatment unit.

“Pulp washing system” means all equipment used to wash pulp and separate spent cooking chemicals following the digester system and prior to the bleaching system, oxygen delignification system or paper machine system at unbleached mills. The pulp washing system equipment includes vacuum drum washers, diffusion washers, rotary pressure washers, horizontal belt filters, intermediate stock chests and their associated vacuum pumps, filtrate tanks, foam breakers or tanks, and any other equipment serving the same function as those previously listed. The pulp washing system does not include docks, screens, knotters, stock chests or pulp storage tanks following the last stage of pulp washing.

“Pulping line” means a group of equipment arranged in series such that the wood chips are digested and the resulting pulp progresses through a sequence of steps that may include knotting, refining, washing, thickening, blending, storing, oxygen delignification and any other equipment serving the same function as those previously listed.

“Pulping process condensates” means any HAP-containing liquid that results from contact of water with organic compounds in the pulping process. Examples of process condensates include digester system condensates, turbine recovery system condensates, evaporator system condensates, HVLC system condensates, HLVC system condensates and any other condensates from equipment serving the same function as those previously listed. Liquid streams that are intended for byproduct recovery are not considered process condensate streams.

“Pulping system” means all process equipment, beginning with the digester system, and up to and including the last piece of pulp conditioning equipment prior to the bleaching system, including treatment with ozone, oxygen or peroxide before the first application of a chemical bleaching agent intended to brighten pulp. The pulping system includes pulping process condensates and can include multiple pulping lines.

“Recovery furnace” means an enclosed combustion device where concentrated spent liquor is burned to recover sodium and sulfur, produce steam and dispose of unwanted dissolved wood components in the liquor.

“Screen system” means equipment in which oversized particles are removed from the pulp slurry prior to the bleaching or papermaking system washed stock storage.

“Secondary fiber pulping” means a pulping process that converts a fibrous material, that has previously undergone a manufacturing process, into pulp stock through the addition of water and mechanical energy. The mill then uses that pulp as the raw material in another manufactured product. These mills may also utilize chemical, heat and mechanical processes to remove ink particles from the fiber stock.

“Semi–chemical pulping” means a pulping process that combines both chemical and mechanical pulping processes. The semi–chemical pulping process produces intermediate yields ranging from 55 to 90%.

“Soda pulping” means a chemical pulping process that uses sodium hydroxide as the active chemical in the cooking liquor.

“Spent liquor” means process liquid generated from the separation of cooking liquor from pulp by the pulping washing system containing dissolved organic wood materials and residual cooking compounds.

“Steam stripper system” means a column, including associated stripper feed tanks, condensers or heat exchangers, used to remove compounds from wastewater or condensates using steam. The steam stripper system also contains all equipment associated with a methanol rectification process including rectifiers, condensers, decanters, storage tanks and any other equipment serving the same function as those previously listed.

“Strong liquor storage tanks” means all storage tanks containing liquor that has been concentrated in preparation for combustion or oxidation in the recovery process.

“Sulfite pulping” means a chemical pulping process that uses a mixture of sulfuric acid and bisulfite ion as the cooking liquor.

“Temperature monitoring device” means a piece of equipment used to monitor temperature and having an accuracy of ±1.0% of the temperature being monitored expressed in degrees Celsius or ±0.5 degrees Celsius (°C), whichever is greater.

“Thermal oxidizer” means an enclosed device that destroys organic compounds by thermal oxidation.

“Turpentine recovery system” means all equipment associated with recovering turpentine from digester system gases including condensers, decanters, storage tanks and any other equipment serving the same function as those previously listed. The turpentine recovery system includes any liquid streams associated with the turpentine recovery process such as turpentine decanter underflow. Liquid streams that are intended for byproduct recovery are not considered turpentine recovery system condensate streams.

“Weak liquor storage tank” means any storage tank except washer filtrate tanks containing spent liquor recovered from the pulping process and prior to the evaporator system.
(2) The owner or operator of each pulping system using a semi-chemical or soda process subject to the requirements of this chapter shall control the total HAP emissions from the following equipment systems, as specified in subs. (3) and (4).
   (a) At each existing affected source, the total HAP emissions from each LVHC system shall be controlled.
   (b) At each new affected source, the total HAP emissions from each LVHC system and each pulp washing system shall be controlled.

(3) Equipment systems listed in subs. (1) and (2) shall be enclosed and vented into a closed-vent system and routed to a control device that meets the requirements specified in sub. (4). The enclosures and closed-vent system shall meet the requirements specified in s. NR 464.08.

(4) The control device used to reduce total HAP emissions from each equipment system listed in subs. (1) and (2) shall do one of the following:
   (a) Reduce total HAP emissions by 98% or more by weight.
   (b) Reduce the total HAP concentration at the outlet of the thermal oxidizer to 20 parts per million or less by volume, corrected to 10% oxygen on a dry basis.
   (c) Reduce total HAP emissions using one of the following:
      1. A thermal oxidizer designed and operated at a minimum temperature of 871°C (1600 °F) and a minimum residence time of 0.75 seconds.
      2. A boiler, lime kiln or recovery furnace by introducing the HAP emission stream with the primary fuel or into the flame zone.
      3. A boiler or recovery furnace with a heat input capacity greater than or equal to 44 megawatts (150 million British thermal units per hour) by introducing the HAP emission stream with the combustion air.

(5) Periods of excess emissions reported under s. NR 464.11 are not a violation of subs. (3) and (4) provided that the time of excess emissions, excluding periods of startup, shutdown or malfunction, divided by the total process operating time in a semiannual reporting period does not exceed any of the following levels:
   (a) One percent for control devices used to reduce the total HAP emissions from the LVHC system.
   (b) Four percent for control devices used to reduce the total HAP emissions from the HVLC system.
   (c) Four percent for control devices used to reduce the total HAP emissions from both the LVHC and HVLC systems.

History: CR 00−175: cr. Register March 2002 No. 555, eff. 4−1−02.

NR 464.04 Standards for the pulping system at sulfite processes. (1) The owner or operator of each sulfite process subject to the requirements of this chapter shall control the total HAP emissions from the following equipment systems as specified in subs. (2) and (3):
   (a) At existing sulfite affected sources, the total HAP emissions from all of the following equipment systems shall be controlled:
      1. Each digester system vent.
      2. Each evaporator system vent.
      3. Each pulp washing system.
   (b) At new affected sources, the total HAP emissions from the equipment systems listed in par. (a) and all of the following equipment shall be controlled:
      1. Each weak liquor storage tank.
      2. Each strong liquor storage tank.
      3. Each acid condensate storage tank.
   (2) Equipment listed in sub. (1) shall be enclosed and vented into a closed-vent system which routes emissions to a control device that meets the requirements specified in sub. (3). The enclosures and closed-vent system shall meet the requirements specified in s. NR 464.08. Emissions from equipment listed in sub. (1) that do not need to be reduced to meet sub. (3) are not required to be routed to a control device.

(3) The total HAP emissions from both the equipment systems listed in sub. (1) and the vents, wastewater and condensate streams from the control device used to reduce HAP emissions shall be controlled as follows:
   (a) Each calcium-based or sodium-based sulfite pulping process shall do one of the following:
      1. Emit no more than 0.44 kilograms of total HAP or methanol per megagram (0.89 pounds per ton) of ODP.
      2. Remove 92% or more by weight of the total HAP or methanol.
   (b) Each magnesium-based or ammonium-based sulfite pulping process shall do one of the following:
      1. Emit no more than 1.1 kilograms of total HAP or methanol per megagram (2.2 pounds per ton) of ODP.
      2. Remove 87% or more by weight of the total HAP or methanol.

History: CR 00−175: cr. Register March 2002 No. 555, eff. 4−1−02.

NR 464.05 Standards for the bleaching system. (1) Each bleaching system that does not use any chlorine or chlorinated compounds for bleaching is exempt from the requirements of this section. Owners or operators of the following bleaching systems shall meet all the provisions of this section:
   (a) Bleaching systems that use chlorine.
   (b) Bleaching systems bleaching pulp from kraft, sulfite or soda pulping processes that use any chlorinated compounds.
   (c) Bleaching systems bleaching pulp from mechanical pulping processes using wood, or from any process using secondary or non-wood fibers, that use chlorine dioxide.

(2) The equipment at each bleaching stage of the bleaching systems listed in sub. (1) where chlorinated compounds are introduced shall be enclosed and vented into a closed-vent system which routes emissions to a control device that meets the requirements specified in sub. (3). The enclosures and closed-vent system shall meet the requirements specified in s. NR 464.08. If process modifications are used to achieve compliance with the emission limits specified in sub. (3) (b) or (c), enclosures and closed-vent systems are not required.

(3) The control device used to reduce chlorinated HAP emissions, not including chloroform, from the equipment specified in sub. (2) shall do one of the following:
   (a) Reduce the total chlorinated HAP mass in the vent stream entering the control device by 99% or more by weight.
   (b) Achieve a treatment device outlet concentration of 10 parts per million or less by volume of total chlorinated HAP.
   (c) Achieve a treatment device outlet mass emission rate of 0.001 kg of total chlorinated HAP mass per megagram (0.002 pounds per ton) of ODP.

(4) The owner or operator of each bleaching system subject to sub. (1) (b) shall comply with par. (a) or (b) to reduce chloroform air emissions to the atmosphere, except the owner or operator of each bleaching system complying with extended compliance under s. NR 464.01 (1) (e) 1. to 3. shall comply with par. (a). The owner or operator shall:
   (a) Comply with the following applicable effluent limitation guidelines and standards specified in 40 CFR part 430:
      1. Dissolving-grade kraft bleaching systems and lines, 40 CFR 430.14 to 430.17.
      2. Paper-grade kraft and soda bleaching systems and lines, 40 CFR 430.24 (a) (1) and (e), and 40 CFR 430.26 (a) and (c).
      3. Dissolving-grade sulfite bleaching systems and lines, 40 CFR 430.44 to 430.47.
      4. Paper-grade sulfite bleaching systems and lines, 40 CFR 430.54 (a) and (c), and 40 CFR 430.56 (a) and (c).
(b) Use no hypochlorite or chlorine for bleaching in the bleaching system or line.

History: CR 00−175; cr. Register March 2002 No. 555, eff. 4−1−02.

NR 464.06 Standards for kraft pulping process condensates. (1) The requirements of this section apply to owners or operators of kraft processes subject to the requirements of this chapter.

(2) The pulping process condensates from the following equipment systems shall be treated to meet the requirements specified in subs. (3), (4) and (5):

(a) Each digester system.

(b) Each turpentine recovery system.

(c) Each evaporator system condensate from both of the following:

1. The vapors from each stage where weak liquor is introduced (feed stages).

2. Each evaporator vacuum system for each stage where weak liquor is introduced (feed stages).

(d) Each HVLC collection system.

(e) Each LVHC collection system.

(3) One of the following combinations of HAP−containing pulping process condensates generated, produced or associated with the equipment systems listed in sub. (2) shall be subject to the requirements of subs. (4) and (5):

(a) All pulping process condensates from the equipment systems specified in sub. (2) (a) to (e).

(b) The combined pulping process condensates from the equipment systems specified in sub. (2) (d) and (e), plus pulping process condensate streams that in total contain at least 65% of the total HAP mass from the pulping process condensates from equipment systems listed in sub. (2) (a) to (e).

(c) The pulping process condensates from equipment systems listed in sub. (2) (a) to (e) that in total contain a total HAP mass of 3.6 kilograms or more of total HAP per megagram (7.2 pounds per ton) of ODP for mills that do not perform bleaching or 5.5 kilograms or more of total HAP per megagram (11.1 pounds per ton) of ODP for mills that perform bleaching.

(4) The pulping process condensates from the equipment systems listed in sub. (2) shall be conveyed in a closed collection system that is designed and operated to meet the requirements specified in pars. (a) and (b):

(a) Each closed collection system shall meet the individual drain system requirements specified in 40 CFR 63.960, 63.961 and 63.962 of subpart RR, except closed−vent systems and control devices shall be designed and operated in accordance with 40 CFR 63.443(d) and 63.450, instead of in accordance with 40 CFR 63.962(a)(3)(ii), (b)(3)(ii)(A) and (5)(iii).

(b) If a condensate tank is used in the closed collection system, the tank shall meet both of the following requirements:

1. The fixed roof and all openings, such as access hatches, sampling ports and gauge wells, shall be designed and operated with no detectable leaks as indicated by an instrument reading of less than 500 parts per million above background, and vented into a closed−vent system that meets the requirements in s. NR 464.08 and routed to a control device that meets the requirements in s. NR 464.03 (4).

2. Each opening shall be maintained in a closed, sealed position, e.g., covered by a lid that is gasketed and latched, at all times that the tank contains pulping process condensates or any HAP removed from a pulping process condensate stream except when it is necessary to use the opening for sampling, removal, or for equipment inspection, maintenance or repair.

(5) Each pulping process condensate from the equipment systems listed in sub. (2) shall be treated according to one of the following options:

(a) Recycle the pulping process condensate to an equipment system specified in s. NR 464.03 (1) meeting the requirements specified in s. NR 464.03 (3) and (4).

(b) Discharge the pulping process condensate below the liquid surface of a biological treatment system and treat the pulping process condensates to meet the requirements specified in par. (c), (d) or (e), and measuring total HAP as specified in 40 CFR 63.457(g).

(c) Treat the pulping process condensates to reduce or destroy the total HAPs by 92% or more by weight.

(d) At mills that do not perform bleaching, treat the pulping process condensates to remove 3.3 kilograms or more of total HAP per megagram (6.6 pounds per ton) of ODP, or achieve a total HAP concentration of 210 parts per million or less by weight at the outlet of the control device.

(e) At mills that perform bleaching, treat the pulping process condensates to remove 5.1 kilograms or more of total HAP per megagram (10.2 pounds per ton) of ODP, or achieve a total HAP concentration of 330 parts per million or less by weight at the outlet of the control device.

(6) Each HAP removed from a pulping process condensate stream during treatment and handling under sub. (4) or (5), except for those treated according to sub. (5) (b), shall be controlled as specified in s. NR 464.03 (3) and (4).

(7) For each control device, such as a steam stripper system or other equipment serving the same function, used to treat pulping process condensates to comply with the requirements specified in sub. (5) (c) to (e), periods of excess emissions reported under s. NR 464.05 are not a violation subs. (4) and (5) (c) to (e) and (6) provided that the time of excess emissions, including periods of startup, shutdown or malfunction, divided by the total process operating time in a semi−annual reporting period does not exceed 10%. The 10% excess emissions allowance does not apply to treatment of pulping process condensates according to sub. (5) (b) as done, for example, with the biological wastewater treatment system used to treat multiple wastewater streams to comply with the clean water act.

(8) Each owner or operator of a new or existing affected source subject to the requirements of this section shall evaluate all new or modified pulping process condensates or changes in the annual bleached or non−bleached ODP used to comply with sub. (9) to determine if they meet the applicable requirements of this section.

(9) For the purposes of meeting the requirements in sub. (3) (b) or (c) or (5) (d) or (e) at mills producing both bleached and unbleached pulp products, owners and operators may meet a prorated mass standard that is calculated by prorating the applicable mass standards (kilograms of total HAP per megagram of ODP) for bleached and unbleached mills specified in sub. (3) (b) or (c) or (5) (d) or (e) by the ratio of annual megagrams of bleached and unbleached ODP.

History: CR 00−175; cr. Register March 2002 No. 555, eff. 4−1−02.

NR 464.07 Clean condensate alternative. As an alternative to the requirements specified in s. NR 464.03 (1) (a) 2. to 5. for the control of HAP emissions from pulping systems using the kraft process, an owner or operator shall demonstrate to the satisfaction of the department, by meeting all the requirements of this section, that the total HAP emissions reductions achieved by this clean condensate alternative technology are equal to or greater than the total HAP emission reductions that would have been achieved by compliance with s. NR 464.03 (1) (a) 2. to 5.

(1) For the purposes of this section only the following additional definitions apply:

(a) “Clean condensate alternative affected source” means the total of all HAP emission points in the pulping, bleaching, causticizing and papermaking systems, exclusive of HAP emissions attributable to additives to paper machines and HAP emission points in the LVHC system.
(b) “Causticizing system” means all equipment associated with converting sodium carbonate into active sodium hydroxide. The equipment includes smelt dissolving tanks, lime mud washers and storage tanks, slakers, slaker grit washers, lime kilns, green liquor clarifiers and storage tanks, and dreg washers ending with the white liquor storage tanks prior to the digestor system, and any other equipment serving the same function as those previously listed.

(c) “Papermaking system” means all equipment used to convert pulp into paper, paperboard or market pulp, including the stock storage and preparation systems, the paper or paperboard machines, and the paper machine white water system, broke recovery systems, and the systems involved in calendering, drying, on-machine coating, slitting, winding and cutting.

(2) Each owner or operator shall install and operate a clean condensate alternative technology with a continuous monitoring system to reduce total HAP emissions by treating and reducing HAP concentrations in the pulping process water used within the clean condensate alternative affected source.

(3) Each owner or operator shall calculate HAP emissions on a kg HAP per megagram of ODP basis and measure HAP emissions according to the appropriate procedures contained in 40 CFR 63.457, incorporated by reference in s. NR 484.03 (6).

(4) Each owner or operator shall determine the baseline HAP emissions for each equipment system and the total of all equipment systems in the clean condensate alternative affected source based on the following:

(a) Process and air pollution control equipment installed and operating on December 17, 1993.

(b) Compliance with the all following requirements that affect the level of HAP emissions from the clean condensate alternative affected source:
   1. The pulping process condensate requirements in s. NR 464.06.
   2. The applicable effluent limitation guidelines and standards in 40 CFR part 430, subparts A, B, D and E.
   3. All other applicable requirements of local, state or federal agencies or statutes.

(5) Each owner or operator shall determine the following HAP emission reductions from the baseline HAP emissions determined in sub. (4) for each equipment system and the total of all equipment systems in the clean condensate alternative affected source:

(a) The HAP emission reduction occurring by complying with the requirements of s. NR 464.03 (1) (a) 2. to 5.

(b) The HAP emissions reduction occurring by complying with the clean condensate alternative technology.

(6) For the purposes of all requirements in this section, each owner or operator may use as an alternative, individual equipment systems, instead of total of all equipment systems, within the clean condensate alternative affected source to determine emissions and reductions to demonstrate achievement of equal or greater than the reductions that would have been achieved by compliance with s. NR 464.03 (1) (a) 2. to 5.

(7) The initial and updates to the control strategy report specified in s. NR 464.11 shall include to the extent possible the following information:

(a) A detailed description of all of the following:
   1. The equipment systems and emission points that comprise the clean condensate alternative affected source.
   2. The air pollution control technologies that would be used to meet the requirements of s. NR 464.03 (1) (a) 2. to 5.
   3. The clean condensate alternative technology to be used.

(b) Estimates and basis for the estimates of total HAP emissions and emissions reductions to fulfill the requirements sub. (4), (5) and (6).

(8) Each owner or operator shall report to the department by the applicable compliance date specified in s. NR 464.01 (1) (d), (e) or (f) the rationale, calculations, test procedures and data documentation used to demonstrate compliance with all the requirements of this section.

History: CR 00−175: cr. Register March 2002 No. 555, eff. 4−1−02.

NR 464.08 Standards for enclosures and closed-vent systems. (1) Each enclosure or closed-vent system specified in ss. NR 464.03 (3), 464.04 (2) and 464.05 (2) for capturing and transporting vent streams that contain HAP shall meet the requirements specified in subs. (2) to (4).

(2) Each enclosure shall maintain negative pressure at each enclosure or hood opening as demonstrated by the procedures specified in 40 CFR 63.457 (e), incorporated by reference in s. NR 484.03 (6). Each enclosure or hood opening closed during the initial performance test specified in 40 CFR 63.457 (b) shall be maintained in the same closed and sealed position as during the performance test at all times except when necessary to use the opening for sampling, inspection, maintenance or repairs.

(3) Each component of the closed-vent system used to comply with ss. NR 464.03 (3), 464.04 (2) and 464.05 (2) that is operated at positive pressure and located prior to a control device shall be designed for and operated with no detectable leaks as indicated by an instrument reading of less than 500 parts per million by volume above background, as measured by the procedures specified in 40 CFR 63.457 (d), incorporated by reference in s. NR 484.03 (6).

(4) Each bypass line in the closed-vent system that could divert vent streams containing HAP to the atmosphere without meeting the emission limitations in ss. NR 464.03 to 464.05 shall comply with either of the following requirements:

(a) On each bypass line, the owner or operator shall install, calibrate, maintain and operate according to manufacturer’s specifications a flow indicator that provides a record of the presence of gas stream flow in the bypass line at least once every 15 minutes. The flow indicator shall be installed in the bypass line in such a way as to indicate flow in the bypass line.

(b) For bypass line valves that are not computer controlled, the owner or operator shall maintain the bypass line valve in the closed position with a car seal or a seal placed on the valve or closure mechanism in such a way that valve or closure mechanism cannot be opened without breaking the seal.

History: CR 00−175: cr. Register March 2002 No. 555, eff. 4−1−02.

NR 464.09 Monitoring requirements. (1) Each owner or operator subject to the standards specified in s. NR 464.03 (3) and (4), 464.04 (2) and (3), 464.05 (2) and (3), 464.06 (3), (4) and (5), 464.07 (2) or 464.08 (4), shall install, calibrate, certify, operate and maintain according to the manufacturer’s specifications, a continuous monitoring system (CMS), as defined in s. NR 464.02 (12), as specified in sub. (2) to (13), except as allowed in sub. (13). The CMS shall include a continuous recorder.

(2) A CMS shall be operated to measure the temperature in the firebox or in the ductwork immediately downstream of the firebox and before any substantial heat exchange occurs for each thermal oxidizer used to comply with the requirements of s. NR 464.03 (4) (a) to (e). Owners and operators complying with the HAP concentration requirements in s. NR 464.03 (4) (b) may install a CMS to monitor the thermal oxidizer outlet total HAP or methanol concentration, as an alternative to monitoring thermal oxidizer operating temperature.

(3) A CMS shall be operated to measure all the following parameters for each gas scrubber used to comply with the bleaching system requirements of s. NR 464.05 (3) or the sulfite pulping system requirements of s. NR 464.04 (3):

(a) The pH or the oxidation/reduction potential of the gas scrubber effluent.

(b) The gas scrubber vent gas inlet flow rate.
(c) The gas scrubber liquid influent flow rate.

(4) As an option to the requirements specified in sub. (3), a CMS shall be operated to measure the chlorine outlet concentration of each gas scrubber used to comply with the bleaching system outlet concentration requirement specified in s. NR 464.05 (3) (b).

(5) The owner or operator of a bleaching system complying with 40 CFR 430.24 shall monitor the chlorine and hypochlorite application rates, in kg of bleaching agent per megagram of ODP of the bleaching system during the extended compliance period specified in s. NR 464.01 (1) (e).

(6) A CMS shall be operated to measure the gas scrubber parameters specified in sub. (3) (a) to (c) or those site specific parameters determined according to the procedures specified in sub. (14) to comply with the sulfite pulping system requirements specified in s. NR 464.04 (3).

(7) A CMS shall be operated to measure all the following parameters for each steam stripper used to comply with the treatment requirements in s. NR 464.06 (5) (c), (d) or (e):
   (a) The process wastewater feed rate.
   (b) The steam feed rate.
   (c) The process wastewater column feed temperature.

(8) As an option to the requirements specified in sub. (7), a CMS shall be operated to measure the methanol outlet concentration to comply with the steam stripper outlet concentration requirement specified in s. NR 464.06 (5) (d) or (e).

(9) A CMS shall be operated to measure the appropriate parameters determined according to the procedures specified in sub. (14) to comply with the condensate applicability requirements specified in s. NR 464.06 (3).

(10) Each owner or operator using an open biological treatment system to comply with s. NR 464.06 (5) (b) shall perform the monitoring procedures specified in either pars. (a) and (b) or par. (c) and shall conduct a performance test each quarter using the procedures specified in par. (d):
   (a) On a daily basis, monitor all the following parameters for each biological treatment unit:
      1. Composite daily sample of outlet soluble BOD₅ concentration to monitor for maximum daily and maximum monthly average.
      3. Horsepower of each aerator unit.
      4. Inlet liquid flow.
      5. Liquid temperature.
   (b) If the Inlet and Outlet Concentration Measurements procedure (Procedure 3) in Appendix C of 40 CFR part 63, incorporated by reference in s. NR 484.04 (25g), is used to determine the fraction of HAP compounds degraded in the biological treatment system as specified in 40 CFR 63.457(l), carry out the sampling and archival requirements specified in subds. 1. and 2.:
      1. Obtain daily inlet and outlet liquid grab samples from each biological treatment unit to have HAP data available to perform quarterly performance tests specified in par. (d) and the compliance tests specified in sub. (16).
      2. Store the samples as specified in 40 CFR 63.457(n) until after the results of the soluble BOD₅ test required in par. (a) 1. are obtained. The storage requirement is needed since the soluble BOD₅ test requires 5 days or more to obtain results. If the results of the soluble BOD₅ test are outside of the range established during the initial performance test, then the archive sample shall be used to perform the mass removal or percent reduction determinations.
   (c) As an alternative to the monitoring requirements of pars. (a) and (b), conduct daily monitoring of the site-specific parameters established according to the procedures specified in sub. (14).
   (d) Conduct a performance test as specified in 40 CFR part 63.457(l) within 45 days after the beginning of each quarter and meet the applicable emission limit in s. NR 464.06 (5) (b).
      1. The performance test conducted in the first quarter, annually, shall be performed for total HAP as specified in 40 CFR 63.457(g) and meet the percent reduction or mass removal emission limit specified in s. NR 464.06 (5) (b).
      2. The remaining quarterly performance tests shall be performed as specified in subd. 1. except owners or operators may use the applicable methanol procedure in 40 CFR 63.457(l)(1) or (2) and the value of r determined during the first quarter test instead of measuring the additional HAP to determine a new value of r.

(11) Each enclosure and closed−vent system used to comply with s. NR 464.08 (1) shall comply with the requirements specified in pars. (a) to (f):
   (a) For each enclosure opening, a visual inspection of the closure mechanism specified in s. NR 464.08 (2) shall be performed at least once every 30 days to ensure the opening is maintained in the closed position and sealed.
   (b) Each closed−vent system required by s. NR 464.08 (1) shall be visually inspected every 30 days and at other times as requested by the department. The visual inspection shall include inspection of ductwork, piping, enclosures and connections to covers for visible evidence of defects.
   (c) For positive pressure closed−vent systems or portions of closed−vent systems, demonstrate no detectable leaks as specified in s. NR 464.08 (3), measured initially and annually by the procedures in 40 CFR 63.457(d), incorporated by reference in s. NR 484.03 (6).
   (d) Demonstrate initially and annually that each enclosure opening is maintained at negative pressure as specified in 40 CFR 63.457(e), incorporated by reference in s. NR 484.03 (6).
   (e) The valve or closure mechanism specified in s. NR 464.08 (4) (b) shall be inspected at least once every 30 days to ensure that the valve is maintained in the closed position and the emission point gas stream is not diverted through the bypass line.
   (f) If an inspection required by pars. (a) to (e) identifies visible defects in ductwork, piping, enclosures or connections to covers required by s. NR 464.08, or if an instrument reading of 500 parts per million by volume or greater above background is measured, or if enclosure openings are not maintained at negative pressure, then the following corrective actions shall be taken as soon as practicable:
      1. A first effort to repair or correct the closed−vent system shall be made as soon as practicable but no later than 5 calendar days after the problem is identified.
      2. The repair or corrective action shall be completed no later than 15 calendar days after the problem is identified. Delay of repair or corrective action is allowed if the repair or corrective action is technically infeasible without a process unit shutdown or if the owner or operator determines that the emissions resulting from immediate repair would be greater than the emission likely to result from delay. Repair of the equipment shall be completed by the end of the next process shutdown.

(12) Each pulping process condensate closed collection system used to comply with s. NR 464.06 (4) shall comply with the requirements of s. NR 464.10 instead of the requirements of 40 CFR 63.964 of subpart RR, except:
   1. Owners and operators shall comply with the recordkeeping requirements of s. NR 464.10 instead of the requirements of 40 CFR 63.964(a)(1)(vi) and (b)(3).
2. Owners and operators shall comply with inspection and monitoring requirements specified in subs. (1) and (11) instead of 40 CFR 63.964(a)(2) of subpart RR.

(b) Each condensate tank used in the closed collection system shall be operated with no detectable leaks as specified in s. NR 464.06 (4) (b) 1., measured initially and annually by the procedures in 40 CFR 63.457(d), incorporated by reference in s. NR 484.03 (6).

(c) If an inspection required by this section identifies visible defects in the closed collection system, or if an instrument reading of 500 ppm or greater above background is measured, then corrective actions specified in 40 CFR 63.964(b) of subpart RR shall be taken.

(13) Each owner or operator using a control device, technique or an alternative parameter other than those specified in subs. (2) to (12) shall install a CMS and establish appropriate operating parameters to be monitored that demonstrate, to the administrator’s satisfaction, continuous compliance with the applicable control requirements.

Note: Under 40 CFR 458(b)(2), implementation of sub. (13) requires approval by EPA.

(14) To establish or reestablish the value for each operating parameter required to be monitored under subs. (2) to (12) and (13) or to establish appropriate parameters for subs. (6), (9), (10) (c) and (13), each owner or operator shall use the following procedures:

(a) During the initial performance test required in 40 CFR 63.457(a), incorporated by reference in s. NR 484.03 (6), or any subsequent performance test, continuously record the operating parameter.

(b) Determinations shall be based on the control performance and parameter data monitored during the performance test, supplemented if necessary by engineering assessments and the manufacturer’s recommendations.

(c) The owner or operator shall provide for the department’s approval the rationale for selecting the monitoring parameters necessary to comply with subs. (6) and (9) and shall provide for the administrator’s approval the rationale for selecting the monitoring parameters necessary to comply with sub. (13).

(d) Provide for the department’s approval the rationale for the selected operating parameter value, and monitoring frequency, and averaging time. Include all data and calculations used to develop the value and a description of why the value, monitoring frequency and averaging time demonstrate continuous compliance with the applicable emission standard.

(15) Each owner or operator of a control device subject to the monitoring provisions of this section shall operate the control device in a manner consistent with the minimum or maximum, as appropriate, operating parameter value or procedure required to be monitored under subs. (1) to (14) and established under this chapter. Except as provided in sub. (16), s. NR 464.03 (5) or 464.06 (7), operation of the control device below minimum operating parameter values or above maximum operating parameter values established under this chapter or failure to perform procedures required by this chapter shall constitute a violation of the applicable emission standard of this chapter and be reported as a period of excess emissions.

(16) The procedures of this paragraph apply to each owner or operator of an open biological treatment system complying with sub. (10) whenever a monitoring parameter excursion occurs, and the owner or operator chooses to conduct a performance test to demonstrate compliance with the applicable emission limit. A monitoring parameter excursion occurs whenever the monitoring parameters specified in sub. (10) (a) 1. to 3. or any of the monitoring parameters specified in sub. (10) (c) are below minimum operating parameter values or above maximum operating parameter values established in sub. (14).

(a) As soon as practical after the beginning of the monitoring parameter excursion, the following requirements shall be met:

1. Before the steps in subd. 2. or 3. are performed, all sampling and measurements necessary to meet the requirements in par. (b) shall be conducted.

2. Steps shall be taken to repair or adjust the operation of the process to end the parameter excursion period.

3. Steps shall be taken to minimize total HAP emissions to the atmosphere during the parameter excursion period.

(b) A parameter excursion is not a violation of the applicable emission standard if the results of the performance test conducted using the procedures in this paragraph demonstrate compliance with the applicable emission limit in s. NR 464.06 (5) (b).

1. Conduct a performance test as specified in 40 CFR 63.457 using the monitoring data specified in sub. (10) (a) to (c) that coincides with the time of the parameter excursion. No maintenance or changes shall be made to the open biological treatment system after the beginning of a parameter excursion that would influence the results of the performance test.

2. If the results of the performance test specified in subd. 1. demonstrate compliance with the applicable emission limit in s. NR 464.06 (5) (b), then the parameter excursion is not a violation of the applicable emission limit.

3. If the results of the performance test specified in subd. 1. do not demonstrate compliance with the applicable emission limit in s. NR 464.06 (5) (b) because the total HAP mass entering the open biological treatment system is below the level needed to demonstrate compliance with the applicable emission limit in s. NR 464.06 (5) (b), then the owner or operator shall perform the following comparisons:

a. If the value of \( f_{bio} \) (MeOH) determined during the performance test specified in subd. 1. is within the range of values established during the initial and subsequent performance tests approved by the department, then the parameter excursion is not a violation of the applicable standard.

b. If the value of \( f_{bio} \) (MeOH) determined during the performance test specified in subd. 1. is not within the range of values established during the initial and subsequent performance tests approved by the department, then the parameter excursion is a violation of the applicable standard.

4. The results of the performance test specified in subd. 1. shall be recorded as specified in s. NR 464.10 (6).

(c) If an owner or operator determines that performing the required procedures under par. (b) for a nonthoroughly mixed open biological system would expose a worker to dangerous, hazardous or otherwise unsafe conditions, all of the following procedures shall be performed:

1. Calculate the mass removal or percent reduction value using the procedures specified in 40 CFR 63.457(1) except the value for \( f_{bio} \) (MeOH) shall be determined using the procedures in Appendix E of 40 CFR part 63, incorporated by reference in s. NR 484.04 (25r).

2. Repeat the procedures in subd. 1. for every day until the unsafe conditions have passed.

3. A parameter excursion is a violation of the standard if the percent reduction or mass removal determined in subd. 1. is less than the percent reduction or mass removal standards specified in s. NR 464.06 (5) (b), as appropriate, unless the value of \( f_{bio} \) (MeOH) determined using the procedures in 40 CFR part 63 Appendix E, as specified in subd. 1. is within the range of \( f_{bio} \) (MeOH) values established during the initial and subsequent performance tests previously approved by the department.

4. The determination that there is a condition that exposes a worker to dangerous, hazardous or otherwise unsafe conditions shall be documented according to requirements in s. NR 464.10 (5) and reporting in s. NR 464.11 (6).
5. The requirements of pars. (a) and (b) shall be performed and met as soon as practical but no later than 24 hours after the conditions have passed that exposed a worker to dangerous, hazardous or otherwise unsafe conditions.

History: CR 00–175: cr. Register March 2002 No. 555, eff. 4–1–02.

NR 464.10 Recordkeeping requirements. (1) The owner or operator of each affected source subject to the requirements of this chapter shall comply with the applicable recordkeeping requirements of ch. NR 460 and the requirements specified in sub. (2) to (6) for the monitoring parameters specified in s. NR 464.09.

(2) For each applicable enclosure opening, closed-vent system and closed collection system, the owner or operator shall prepare and maintain a site-specific inspection plan, including a drawing or schematic of the components of applicable affected equipment, and shall record all of the following information for each inspection:

(a) Date of inspection.

(b) The equipment type and identification.

(c) Results of negative pressure tests for enclosures.

(d) Results of leak detection tests.

(e) The nature of the defect or leak and the method of detection, that is, visual inspection or instrument detection.

(f) The date the defect or leak was detected and the date of each attempt to repair the defect or leak.

(g) Repair methods applied in each attempt to repair the defect or leak.

(h) The reason for the delay if the defect or leak is not repaired within 15 days after discovery.

(i) The expected date of successful repair of the defect or leak if the repair is not completed within 15 days.

(j) The date of successful repair of the defect or leak.

(k) The position and duration of opening of bypass line valves and the condition of any valve seals.

(L) The duration of the use of bypass valves on computer controlled valves.

(3) The owner or operator of a bleaching system complying with s. NR 464.01 (1) (e) 2. shall record the daily average chlorine and hypochlorite application rates, in kg of bleaching agent per megagram of ODP, of the bleaching system until the requirements specified in s. NR 464.01 (1) (e) 1. are met.

(4) The owner or operator shall record the CMS parameters specified in s. NR 464.09 and the requirements specified in sub. (1) for any new affected process equipment or pulping process condensate stream that becomes subject to the standards in this chapter due to a process change or modification.

(5) The owner or operator of an open nontothoroughly mixed biological treatment system complying with s. NR 464.09 (16) (c) instead of s. NR 464.09 (16) (b) shall prepare a written record identifying the specific conditions that would expose a worker to dangerous, hazardous or otherwise unsafe conditions. The record shall include a written explanation of the specific reason or reasons why a worker would not be able to perform the sampling and test procedures specified in 40 CFR 63.457(d).

(6) The owner or operator of an open biological treatment system complying with s. NR 464.09 (16) shall prepare a written record specifying the results of the performance test specified in s. NR 464.09 (16) (b).

History: CR 00–175: cr. Register March 2002 No. 555, eff. 4–1–02.

NR 464.11 Reporting requirements. (1) Each owner or operator of a source subject to this chapter shall comply with the reporting requirements of ch. NR 460 as specified in Appendix S of ch. NR 460 and all the following requirements in this section.

The initial notification report specified in s. NR 460.08 (2) (b) shall have been submitted by April 15, 1999 for existing sources.

(2) Each owner or operator of a kraft pulping system specified in s. NR 464.01 (1) (d) 1. or a bleaching system specified in s. NR 464.01 (1) (e) 1. to 3. shall submit, with the initial notification report specified in s. NR 460.08 (2) (b) and sub. (1) and update every 2 years thereafter, a non-binding control strategy report containing, at a minimum, the information specified in pars. (a) to (c) in addition to the information required in s. NR 460.08 (2) (b):

(a) A description of the emission controls or process modifications selected for compliance with the control requirements in this standard.

(b) A compliance schedule, including the dates by which each step toward compliance will be reached for each emission point or sets of emission points. At a minimum, the list of dates shall include all of the following:

1. The date by which the major study or studies for determining the compliance strategy will be completed.

2. The date by which contracts for emission controls or process modifications will be awarded, or the date by which orders will be issued for the purchase of major components to accomplish emission controls or process changes.

3. The date by which on-site construction, installation of emission control equipment or a process change is to be initiated.

4. The date by which on-site construction, installation of emissions control equipment or a process change is to be completed.

5. The date by which final compliance is to be achieved.

6. For compliance with s. NR 464.01 (1) (e) 1. to 3., the tentative dates by which compliance is to be achieved with effluent limitation guidelines and standards for intermediate pollutant load effluent reductions, and, as available, all the dates for the best available technology’s milestones reported in the national pollutant discharge elimination system authorized under section 402 of the clean water act (33 USC 1342) and for the best professional milestones in the voluntary advanced technology incentives program under 40 CFR 430.24(b) (2).

7. The date by which the final compliance tests shall be performed.

(c) Until compliance is achieved, revisions or updates shall be made to the control strategy report required by this subsection indicating the progress made towards completing the installation of the emission controls or process modifications during the 2-year period.

(3) The owner or operator of each bleaching system complying with s. NR 464.01 (1) (e) 2. shall certify in the report specified under s. NR 460.09 (5) (c) that the daily application rates of chlorine and hypochlorite for that bleaching system have not increased as specified in s. NR 464.01 (1) (e) 2. until the requirements of s. NR 464.01 (1) (e) 1. are met.

(4) The owner or operator shall meet the requirements specified in sub. (1) upon startup of any new affected process equipment or pulping process condensate stream that becomes subject to the standards of this chapter due to a process change or modification.

(5) If the owner or operator uses the results of the performance test required in s. NR 464.09 (16) (b) to revise the approved values or ranges of the monitoring parameters specified in s. NR 464.09 (10) (a) to (c), the owner or operator shall submit an initial notification of the subsequent performance test to the department as soon as practicable, but no later than 15 days, before the performance test required in s. NR 464.09 (16) (b) is scheduled to be conducted. The owner or operator shall notify the department as soon as practicable, but no later than 24 hours, before the performance test is scheduled to be conducted to confirm the exact date and time of the performance test.

(6) To comply with the open biological treatment system monitoring provisions of s. NR 464.09 (16) (c), the owner or operator shall notify the department as soon as practicable of the onset...
of the dangerous, hazardous or otherwise unsafe conditions that did not allow a compliance determination to be conducted using the sampling and test procedures in 40 CFR 63.457(l). The notification shall occur no later than 24 hours after the onset of the dangerous, hazardous or otherwise unsafe conditions and shall include the specific reason or reasons that the sampling and test procedures in 40 CFR 63.457(l) could not be performed.

History: CR 00−175; cr. Register March 2002 No. 555, eff. 4−1−02.
