9. 'Deer quotas'. a. Deer quotas are primarily based on the following considerations: the status of unit deer populations in relation to established population goals as determined by inventories, the past effect of varying antlerless harvest levels on unit deer populations gained from many years experience with the quota system, and the estimated impact of the previous winter's severity on deer survival and subsequent fawn production. The department shall issue party permits, antlerless permits or hunter's choice permits in sufficient numbers to assure main-

tenance of overwintering deer populations for each quota area indicated in subd. e.

b. Quota areas are composed of single management units or parts of units, the boundaries of which are established in s. NR 10.28.

c. In each quota area, the number of permits to be issued to harvest the desired numbers of deer shall be based on an average of the hunter success rates from the most recent 3 previous seasons or by an average of fewer seasons where a 3-year average is not available. In establishing a quota for an area without an adequate history of permits, the average success rates of similar quota areas shall be applied or the department shall estimate an anticipated success rate.

d. Permit success rates used to compute the number of permits to be issued for each quota shall be those calculated by the department from annual deer season harvest reports except where no previous history of success rates exist.

The success rate formula is:

$$\text{Success rate} = \frac{\text{Number of antlerless deer harvested}}{\text{Number permits issued}}$$

The permit number formula is:

$$\text{Permit number} = \frac{\text{Quota deer to be harvested}}{\text{Hunter success rate}}$$

e. Deer management units, overwinter population goals expressed in terms of deer per square mile of deer range and 1983 deer quota are as follows:
