**RESIDENTIAL WELL AIR FILTRATION**

Residential wells, in certain instances, would be required to filter air that enters the well to prevent airborne bacteria from contaminating the well water. Industry standard requires a .22-micron filter that will bar bacteria from entering the well.

A filter installation would be required in one of two situations: (1) when a residential well tests positive for bacteria; and (2) when a new well is installed. In all other instances, installing a bacteria filter would be the option of the well owner.

This would only apply to wells that are drilled, with a casing, not driven (sandpoint).
